Introduction Study purpose / aims Methodology

Preeclampsia or
hypertensive disorder of pregnancy is
one of the main causes of perinatal
and maternal morbidity and mortality.
Apply a nursing care
plan to a patient with severe
preeclampsia.

Expose the role of nursing in the

care of patients with severe preeclampsia from the perspective of Marjory Gordon's functional patterns.

Study with a qualitative approach, single clinical case type, which included a 34 year old primiparous patient. Marjorie Gordon's functional health pattern assessment framework was used for data collection. The interview and observation were used as a technique; for the care plan, the taxonomies

Results Impact

8 altered patterns were found and 9 nursing diagnoses were formulated. The main diagnosis was: ineffective peripheral tissue perfusion, according to the AREA Model. A care plan was implemented and a satisfactory change score was obtained that allowed a favorable evolution until admission to the Operating Room, where a healthy delivery was obtained.

The problems identified from the solution of the main diagnosis and the risk of main complication were resolved.
